

Missing all your teeth

You only need 4-6 implants to support a bridge of all of the missing teeth, greatly reducing the bone loss that occurs with conventional dentures.

Dental implants will provide you with a stable and long term solution that reduces the pain, discomfort, instability, and bone loss that denture patients experience. The bridges can be made to be screwed in place, or can be removable.

A very cost-effective alternative is to have a denture that is secured in place with implants.

Problem

Upper and/or lower teeth missing or failing

- Remaining teeth unable to support a denture or bridge
- Loose, uncomfortable or poorly fitting denture

Solution

Implants supporting a permanently fixed bridge

- Looks and functions like natural teeth that are completely secure and cannot move
- Only removable by a dentist
- The ultimate solution

Implants supporting a removable bridge

- Solid foundation for natural chewing function that look like natural teeth
- Less bulky than a denture
- Easily removed for cleaning

Implants supporting a denture

- Very cost effective
- Can be removed for cleaning
- Very secure but still allows some movement during normal chewing

Alternatives

Complete conventional denture

- Lack of confidence and comfort due to limitation in what can be eaten
- Possible impairment of eating, speech, confidence
- The pressure from an unsupported conventional denture during chewing reduces the blood supply to the gums and contributes to accelerated bone shrinkage
- Denture will need to be regularly relined and replaced every few years
